Chapter 2

Object Oriented Logic Modeling

Zainalabedin Navabi

Object Oriented Logic Modeling

Procedural Languages for Hardware Modeling
Types and Operators for Logic Modeling
+ Basic Logic Simulation
+ Enhanced Logic Simulation with Timing
+ More Functions for Wires and Gates
+ Inheritance in Logic Structures
+ Hierarchical Modeling of Digital Components
Summary

Object Oriented Logic Modeling

- Procedural Languages for Hardware Modeling
- Types and Operators for Logic Modeling
- Basic Logic Simulation
  - Logic functions
  - Building higher level structures
  - Handling 4-value logic
  - Logic vector
  - Sequential circuit modeling
  - Using pointers for logic vectors
- Enhanced Logic Simulation with Timing
  - Using *struct* for timing and logic
  - Gates that handle timing
  - Utility functions
  - Timing in logic structures
  - Overloading logical operators
  - Using Boolean expressions
- More Functions for Wires and Gates
  - Gate classes
  - Carrier generic modeling
  - Pointer-based logic classes
  - Gate classes with power and timing calculation
  - Wire and gate vectors

Object Oriented Logic Modeling

- Inheritance in Logic Structures
  - A generic gate definition
  - Gates to include timing
  - Building structures from objects
- Hierarchical Modeling of Digital Components
  - Wire functionalities
  - Gate functionalities
  - Polymorphic gate base
  - Flip flop description hierarchies

Object Oriented Logic Modeling

Object Oriented Logic Modeling

Procedural Languages for Hardware Modeling

Types and Operators for Logic Modeling

+ Basic Logic Simulation
+ Enhanced Logic Simulation with Timing
+ More Functions for Wires and Gates
+ Inheritance in Logic Structures
+ Hierarchical Modeling of Digital Components

Summary

Types and Operators for Logic Modeling

Group	Type names	Note on size/Precision
Character Types	Char	Exactly one byte in size. At least 8 bits
Integer Types (signed)	Signed Char	Same size as char. At least 8 bits
	Signed Int	At least 16 bits
Integer Types (unsigned)	Unsigned Char	Same size as char. At least 8 bits
	Unsigned Int	At least 16 bits
Floating-point Type	Float	
	Double	Precision not less than float
	Long Double	Precision not less than float
Boolean Type	Bool	
Void Type	Void	No storage

Types and Operators for Logic Modeling

Using Boolean Type

Ref. [1] –
Declaration of variables - P. 12
Scope of variables - P. 14
Initialization of variables - P.15

known as C-like initialization

known as constructor initialization

Boolean AND Operator

Ref. [1] – Operators
- P. 21-28

Boolean Type.h

```
#include <iostream>
using namespace std;
```

Boolean Type.cpp

```
#include "Boolean Type.h"

int main ()
{
    //bool a = true;
    //bool b = false;
    bool a(0);
    bool b(1);
    bool anding;
    int go;
    cout << "Performing Logic Simulation . . .\n";
    anding = a && b;
    cout << "a:" << a << "; b:" << b << "; anding:" << anding << "\n";
    cout << "Enter 0 to exit:";
    cin >> go;

    return 0;
}
```

Types and Operators for Logic Modeling

- Using Char Type

Ref. [1] – Preprocessor directives - P.133-P.134

Macro Declaration: Converts '0' and '1' to 0 and 1 for Boolean operations

Iteration Structure: while loop

Ref. [1] – Control Structures - P. 34-40

Selective Structure: switch case

Character Type.h

```
#include <iostream>
using namespace std;
```

Character Type.cpp

```
#include "Character Type.h"

#define BIT(c)(c=='0'?0:1)

int main ()
{
    char i1 = '0';
    char i2 = '0';
    char op;
    bool go(1);
    while (go) {
        cout << "Enter Operation (A, O, X) followed by input values: ";
        cin >> op >> i1 >> i2;
        switch (op) {
        case 'A': case 'a':
            cout << i1 << " AND " << i2 << " is: " << (BIT(i1) && BIT(i2)) << '\n';
            break;
        case 'O': case 'o':
            cout << i1 << " OR " << i2 << " is: " << (BIT(i1) || BIT(i2)) << '\n';
            break;
        case 'X': case 'x':
            cout << i1 << " XOR " << i2 << " is: " << (BIT(i1) != BIT(i2)) << '\n';
            break;
        default:
            cout << "Wrong operation \n";
        }
        cout << "Enter 0 to end:"; cin >> go;
    }
    return 0;
}
```

Types and Operators for Logic Modeling

Using Enumeration

Creating a new data type using *enum*

Enumerations are type compatible with numeric variables

Constant arrays

Conditional Structure: if - else

Ref. [1] – Enumerations - P.84-P.85

Ref. [1] – Constants - P. 17-20 Arrays - P. 54-59

Ref. [1] – Control Structures - P. 34-40

Four Value System.h

```
Four Value System.h | Enum Type | (Global Scope)
1  #include <iostream>
2  #include <string>
3  using namespace std;
4
5  enum lv4 {lX, l0,l1, lZ};
6  const lv4 lv4Value [4] = {lX, l0, l1, lZ};
7  const string lv4Image [4] = {"lX", "l0", "l1", "lZ"};
```

Four Value System.cpp

```
Four Value System.cpp | Enum Type | (Global Scope)
1  #include "Four Value System.h"
2
3  lv4 ANDlv4 (lv4 a, lv4 b)
4  {
5      lv4 w;
6      if (a==lX || b==lX || a==lZ || b==lZ) w=lX;
7      else if (a==l1 && b==l1) w=l1;
8      else w=l0;
9      return w;
10 }
11
12 lv4 ORlv4 (lv4 a, lv4 b){ ... }
20
21 lv4 XORlv4 (lv4 a, lv4 b){ ... }

21  lv4 XORlv4 (lv4 a, lv4 b){ ... }
29
30  int main ()
31  {
32      lv4 i1 = lX;
33      lv4 i2 = lX;
34      lv4 out = lX;
35      int Ii1, Ii2, Iout;
36      char op;
37      bool go;
38      do {
39          cout << "Enter operation (A,O,X), then inputs (0 to 3): ";
40          cin >> op >> Ii1 >> Ii2;
41          i1=lv4Value[Ii1]; i2=lv4Value[Ii2];
42          switch (op) {
43              case 'A': out = ANDlv4 (i1, i2); break;
44              case 'O': out = ORlv4 (i1, i2); break;
45              case 'X': out = XORlv4 (i1, i2); break;
46              default: out = lX;
47          }
48          cout << i1 << " " << op << " " << i2;
49          cout << ", is: " << out << '\n';
50          cout << lv4Image[i1] << " " << op << " " << lv4Image[i2];
51          cout << ", is: " << lv4Image[out] << '\n';
52          cout << "Enter 0 to end:"; cin >> go;
53      } while (go);
54      return 0;
55  }
56
```

100 %

Four Value System.cpp

Convert Integer value to lv4 enumeration type

Conversion to string for printing

Iteration Structure: do-while loop

Ref. [1] – Control Structures - P. 34-40

Types and Operators for Logic Modeling

- Using String
  - Waveform Generation

String is not a fundamental type, but it behaves in a similar way

MIN Macro Declaration

The *wave* function gets a sequence of 1s and 0s and turns into waveform

This function is equivalent to BIT macro

The *operation* function:
Bool is good for logical operations

Ref. [1] – Introduction to strings - P. 15-16

Ref. [1] – Functions (I) - P. 41-46

String Character.h

```
#include <iostream>
#include <string>
using namespace std;
```

String Character.cpp

```
#define MIN(a,b)((a<b)?a:b)

int wave (string seq)
{   int i, l;
    l = seq.length();
    for (i=0; i < l; i++)
    {
        if (seq[i]=='0') cout << "__";
        else cout << "--";
    }
    cout << '\n';
    return l;
}

bool char2bool (char c)
{
    if (c=='0') return 0;
    else return 1;
}

bool operation (string fn, bool in1, bool in2)
{
    bool out;
    if (fn == "AND" || fn == "and") out = in1 && in2;
    else if (fn == "OR" || fn == "or") out = in1 || in2;
    else if (fn == "XOR" || fn == "xor") out = in1 != in2;
    else out = 0;
    return out;
    }
```

Types and Operators for Logic Modeling

- Using String (cont.)
  - Waveform Generation

Ref. [1] – Control Structures - P. 34-40

Calling the functions

Using the macro: for calculating the output waveform length

Iteration Structure: for loop

String Character.cpp

String Character.cpp | String Characters | (Global Scope)

```
17  bool char2bool (char c){ ... }
22
23  bool operation (string fn, bool in1, bool in2){ ... }
32
33  int main ()
34  {
35      string i1Seq, i2Seq;
36      string logic;
37      int i, i1Len, i2Len, outLen;
38      bool i1=0, i2=0, out=0;
39      bool go(1);
40      while (go) {
41          cout << "Enter logic type and input sequences: ";
42          cin >> logic >> i1Seq >> i2Seq;
            i1Len=wave (i1Seq);
            i2Len=wave (i2Seq);
            outLen = MIN (i1Len, i2Len);
46          string outSeq (outLen, '0');
47          for (i=0; i<outLen; i++) {
48              i1 = char2bool (i1Seq[i]);
49              i2 = char2bool (i2Seq[i]);
                out=operation(logic, i1,i2);
51              outSeq[i] = out ? '1' : '0';
52          }
53          outLen=wave (outSeq); cout << '\n';
54          cout << "Enter 0 to end:"; cin >> go;
55      }
56      return 0;
57  }
58
```

Summary

Logic Functions

Gate Function Prototypes

Ref. [1] – Functions (II) - P. 47-49

Passed by value

Passed by reference

Passing function as an argument

Using default values

Logic vector modeling using arrays

logicGates.h

Logic Simulation | (Global Scope)

```
#include <iostream>
using namespace std;
```

LogicGates.h

primitives.h

Logic Simulation | (Global Scope)

```
bool and (bool a, bool b);
bool or (bool a, bool b);
bool not (bool a);
bool nand (bool a, bool b);
bool nor (bool a, bool b);
bool xor (bool a, bool b);

void and (bool a, bool b, bool& w);
void or (bool a, bool b, bool& w);
void not (bool a, bool& w);
void nand (bool a, bool b, bool& w);
void nor (bool a, bool b, bool& w);
void xor (bool a, bool b, bool& w);

bool logic (bool a, bool b, void (*f) (bool, bool, bool&));

bool and5 (bool a=true, bool b=true, // up to 5 inputs
           bool c=true, bool d=true, bool e=true);
bool or5  (bool a=false, bool b=false,
           bool c=false, bool d=false, bool e=false);
bool xor5 (bool a=false, bool b=false,
           bool c=false, bool d=false, bool e=false);

void and (bool[], bool[], bool[], const int);
void or (bool[], bool[], bool[], const int);
```

Primitives.h

To use this function with fewer arguments, all arguments must have default values

Logic Functions

- Gate Function Prototypes (cont.)

Functions are overloaded for various type of procedure and vector format

Ref. [1] – Overloaded functions - P. 50

Passed by value

Passed by reference

Passing function as an argument

primitives.cpp | logicGates.cpp

Logic Simulation | (Global Scope)

Primitives.cpp

```
bool and (bool a, bool b)
{
    return (a && b);
}

bool or (bool a, bool b){ ... }

bool not (bool a){ ... }

bool nand (bool a, bool b){ ... }

bool nor (bool a, bool b){ ... }

bool xor (bool a, bool b){ ... }

void and (bool a, bool b, bool& w)
{
    w = a && b;
}

void or (bool a, bool b, bool& w){ ... }

void not (bool a, bool& w){ ... }

void nand (bool a, bool b, bool& w){ ... }

void nor (bool a, bool b, bool& w){ ... }

void xor (bool a, bool b, bool& w){ ... }

bool logic (bool a, bool b, void (*f) (bool, bool, bool&))
{
    bool w;
    (*f) (a, b, w);
    return (w);
}
```

100 %

Passing by reference

- allows to manipulate from inside a function the value of an external variable
- is also an effective way to allow a function to return more than one value

Building Higher Level Structures

- Calling three groups of the logic functions for three different implementations of full-adder

Order matters in procedural languages

primitives.cpp | logicGates.cpp*

Logic Simulation | (Global Scope)

```
1  #include "logicGates.h"
2  #include "primitives.h"
3
4  void fullAdder (bool a, bool b, bool ci, bool& co, bool& sum)
5  {
6      bool axb, ab, abc;
7
8      axb = xor (a, b);
9      ab  = and (a, b);
10     abc = and (axb, ci);
11     co = or (ab, abc);
12     sum = xor (axb, ci);
13 }
```

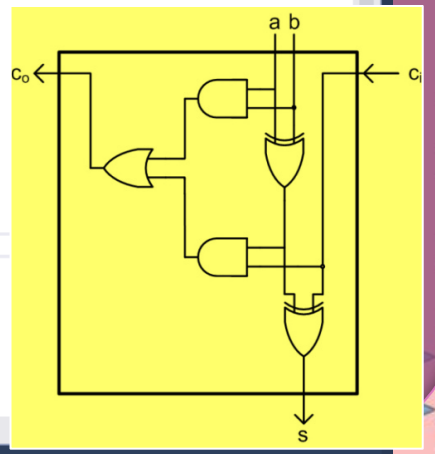
primitives.cpp | logicGates.cpp*

Logic Simulation | (Global Scope)

logicGates.cpp

```
1  #include "logicGates.h"
2  #include "primitives.h"
3
4  /* ... */
16
17 /* ... */
29
30 void fullAdder (bool a, bool b, bool ci, bool& co, bool& sum)
31 {
32     bool axb, ab, abc;
33
34     axb = logic (a, b, xor); // uses: void xor (bool, bool, bool&);
35     ab  = logic (a, b, and);
36     abc = logic (axb, ci, and);
37     co  = logic (ab, abc, or);
38     sum = logic (axb, ci, xor);
39 }
40
41 void fullAdder (bool a, bool b, bool ci, bool& co, bool& sum)
42 {
43     bool ab, bc, ac;
44
45     ab = and5 (a, b);
46     bc = and5 (b, ci);
47     ac = and5 (a, ci);
48     co = or5 (ab, bc, ac);
49     sum = xor5 (a, b, ci);
50 }
51
52 int main () { ... }
66
67
```

100 %



Building Higher Level Structures

- Calling the full-adder in *main* as a testbench

primitives.cpp | logicGates.cpp*

Logic Simulation | (Global Scope)

logicGates.cpp

```
1   #include "logicGates.h"
2   #include "primitives.h"
3
15  /* ... */
27
28  /* ... */
54  int main ()
55  {
56      bool a, b, c, co, sum;
57
58      do {
59          cout << "Enter a, b, c: "; cin >> a >> b >> c;
60
61          fullAdder (a, b, c, co, sum);
62
63          cout << "Carry:" << co << " Sum:" << sum << "\n";
64
65          cout << "\n" << "Continue?"; cin >> a;
66      } while (a != false);
67  }
68
69
```

100 %

Handling 4-value Logic

- Four-Value Logic System

Value	Description
0	Forcing 0 or Pulled 0
1	Forcing 1 or Pulled 1
Z	Float or High Impedance
X	Uninitialized or Unknown

Z is the weakest logic value

X is the strongest logic value

Handling 4-value Logic

- Using *char* for handling 4-value logic due to easier and more expressive *in* and *out*

characterFunctions.h

Character Logic | (Global Scope)

```
1  #include <iostream>
2  using namespace std;
3
```

100 %

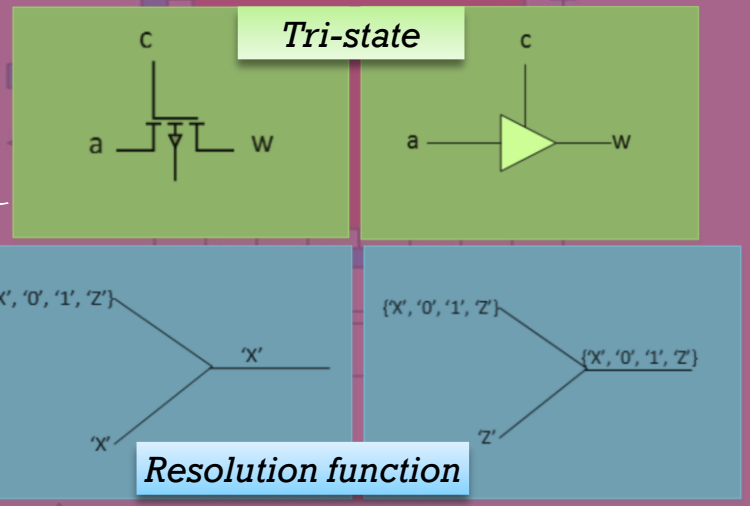
characterPrimitives.h

Character Logic | (Global Scope)

```
1  char and (char a, char b);
2  char or (char a, char b);
3  char not (char a);
4  char tri (char a, char c);
5  char resolve (char a, char c);
6  char xor (char a, char b);
7
8  void fullAdder (char a, char b, char ci, char & co, char & sum);
9
```

CharacterFunctions.h

CharacterPrimitives.h



Handling 4-value Logic

- We have to generate our own logical functions
- This happens one and can easily be reused

Resolution function

b \ a	x	0	1	z
x	x	x	x	x
0	x	0	x	0
1	x	x	1	1
z	x	0	1	z

characterPrimitives.cpp | characterFunctions.cpp

Character Logic | (Global Scope)

CharacterPrimitives.cpp

```
1   #include "characterPrimitives.h"
2
3   char and (char a, char b)
4   {
5       if ((a=='0')||(b=='0')) return '0';
6       else if ((a=='1')&&(b=='1')) return '1';
7       else return 'X';
8   }
9
10  char or (char a, char b) { ... }
16
17  char not (char a) { ... }
23
24  char tri (char a, char c) { ... }
29
30  char resolve (char a, char b)
31  {
32      if (a=='Z' || a==b) return b;
33      else if (b=='Z') return a;
34      else return 'X';
35  }
36
37  char xor (char a, char b) { ... }
43
44  void fullAdder (char a, char b, char ci, char & co, char & sum)
45  {
46      char axb, ab, abc;
47
48      axb = xor (a, b);
49      ab  = and (a, b);
50      abc = and (axb, ci);
51      co = or (ab, abc);
52      sum = xor (axb, ci);
53  }
54
55
```

Overloaded AND using *char*

The *resolve* function using *char*

Using the *char* type logic functions for the full-adder implementation

100 %

Handling 4-value Logic

- Using *char* for the multiplexer implementation

Behavioral implementation of Multiplexer

Structural implementation of Multiplexer with OE (Output Enable)

CharacterFunctions.cpp

characterPrimitives.cpp | characterFunctions.cpp

Character Logic | (Global Scope)

```
1  #include "characterPrimitives.h"
2  #include "characterFunctions.h"
3
4  void muxStd2TO1 (char a, char b, char& w, char sel)
5  {
6      w = (sel=='1') ? b : a;
7  }
8
9  void muxTri2TO1 (char a, char b, char& w, char sel, char oe)
10 {
11     char selB, selB_oe, sel_oe;
12     char asel;

Logic Vector

- Overloaded logic functions for vector format
  - Using Boolean Type (cont.)

Logic Vector

- Overloaded logic functions for vector format
  - Using Char Type
    - Removes the complications of using Boolean type including
      a) Entering the size of vector
      b) Requiring the conversion functions (*getBits* or *putBits*)

By default, arrays are passed by reference to first location

In Char type, the null character ('\0') marks the end of the vector

characterVectorFunctions.cpp | characterVectorFunctions.h | characterVectorPrimitives.h

Object Oriented Logic Modeling

Procedural Lang. for Hardware Modeling
Types and Operators for Logic Modeling
+ Basic Logic Simulation
– Enhanced Logic Simulation with Timing
  - Using *struct* for timing and logic
  - Gates that handle timing
  - Utility functions
  - Timing in logic structures
  - Overloading logical operators
  - Using Boolean expressions
+ More Functions for Wires and Gates
+ Inheritance in Logic Structures
+ Hierarchical Modeling of Digital Components
Summary

Using *struct* for Timing and Logic

- Data structure
  - is a group of data elements (known as members) grouped together under one name

Structure to accommodate time as well as logic

timedPrimitives.h

```
timedFunctions.cpp | timedPrimitives.h | timedPrimitives.cpp | timedFunctions.h
Timed Logic Structs | (Global Scope)
1  struct tlogic {
2      char logic;
3      int time;
4  };
5
6  tlogic and (tlogic a, tlogic b, int delay);
7  tlogic or (tlogic a, tlogic b, int delay);
8  tlogic not (tlogic a, int delay);
9  tlogic xor (tlogic a, tlogic b, int delay);
10
```

Ref. [1] – Data structures - P. 77-81

Gates that Handle Timing

- A more accurate delay propagation requires the gate function to be aware of its previous output value

AND logic function with timing

timedPrimitives.cpp

timedFunctions.cpp | timedPrimitives.h | timedPrimitives.cpp | timedFunctions.h

Timed Logic Structs | (Global Scope)

```
1   #include "timedPrimitives.h"
2
3   tlogic and (tlogic a, tlogic b, int delay)
4   {
5       tlogic tl;
6       if ((a.logic=='0')||(b.logic=='0')) {
7           tl.logic = '0';
8           if (a.logic=='0') tl.time = a.time + delay;
9           else tl.time = b.time + delay;
10      }
11      else if ((a.logic=='1')&&(b.logic=='1')) {
12          tl.logic = '1';
13          if (a.time > b.time) tl.time = a.time + delay;
14          else tl.time = b.time + delay;
15      }
16      else {
17          tl.logic = 'X';
18          if (a.logic != '1') tl.time = a.time + delay;
19          else tl.time = b.time + delay;
20      };
21      return tl;
22  }
23
24  tlogic or (tlogic a, tlogic b, int delay) { ... }
44
45  tlogic not (tlogic a, int  delay) { ... }
54
55  tlogic xor (tlogic a, tlogic b, int delay)
56  {
57      tlogic tl;
58      if (a.logic==b.logic) tl.logic = '0';
59      else tl.logic = '1';
60      if (a.time > b.time) tl.time = a.time + delay;
61      else tl.time = b.time + delay;
62      return tl;
63  }
64
```

100 %

Utility Functions

- The following table summarizes possible combinations of pointers and structure members

Expression	What is evaluated	Equivalent
a.b	Member b of object a	
a->b	Member b of object pointed by a	(*a).b
*a.b	Value pointed by member b of object a	*(a.b)

timedFunctions.cpp

```
#include "timedPrimitives.h"
#include "timedFunctions.h"
#include "characterPrimitives.h"

#define MAX(a,b) (a>b?a:b);
#define MIN(a,b) (a<b?a:b);

void getVect (string vectorName, int numBits, tlogic values[])
{ //order according to bit significance
    string valuesS;
    int i, bits, delay;
    cout << "Enter " << numBits << " bits of " << vectorName << ": ";
    cin >> valuesS;
    bits = MIN (valuesS.length(), numBits); // if fewer are entered
    cout << "Enter vector delay: "; cin >> delay;
    for (i=bits-1; i>=0; i--) {
        values[i].logic = char(valuesS[bits-1-i]); // reverse bits
//      values[i].time = delay; // This or two below are good
//      (*(values+i)).time = delay;
        (values+i)->time = delay;
    }
}

void putVect (string vectorName, int numBits, tlogic values[])
{
    int i, delay;
    delay = 0;
    cout << vectorName << ": ";
    for (i=numBits-1; i>=0; i--) {
        cout << values[i].logic;
        if (values[i].time > delay) delay=values[i].time;
    }
    cout << " AT " << delay << "\n";
}

void fullAdder (tlogic a, tlogic b, tlogic ci, tlogic& co, tlogic& sum) { ... }

void nBitAdder (tlogic a[], tlogic b[], tlogic c[], tlogic sum[], int bits) { ... }

void nBitAdder (tlogic* a, tlogic* b, tlogic* c, tlogic* sum, int bits, int worstDelay) { ... }
```

The function gets a vector and its delay

Entered: 1011
valuesS: 1011
values: 1101

The arrow operator (->) is a dereference operator that is used with pointers to objects with members

The function puts a vector and its delay

Timing in Logic Structures

92      }
93  }
94
```

The operator *new* is used to allocate dynamic memory

Multiple bit *char* based carry ripple adder calculates all propagations

The operator *delete* is used to delete the memory allocated

100 %

Overloading Logical Operators

- Overloaded operators for the *tlogic struct* type
  - Operation itself does not have a delay
  - Operands have the delays and can be carried over to the output

timedOperators.h

Structure to accommodate time as well as logic

```
struct tlogic {
    char logic;
    int time;
};

tlogic operator& (tlogic a, tlogic b);
tlogic operator| (tlogic a, tlogic b);
tlogic operator~ (tlogic a);
tlogic operator^ (tlogic a, tlogic b);
```

Ref. [1] – Overloading operators - P. 95-97

timedOperators.cpp

```
#include "timedOperators.h"

tlogic operator& (tlogic a, tlogic b){ ... }

tlogic operator| (tlogic a, tlogic b){ ... }

tlogic operator~ (tlogic a)
{
    tlogic tl;
    if (a.logic=='1') tl.logic = '0';
    else if (a.logic=='0') tl.logic = '1';
    else tl.logic=='X';
    tl.time = a.time;
    return tl;
}

tlogic operator^ (tlogic a, tlogic b)
{
    tlogic tl;
    if (a.logic==b.logic) tl.logic = '0';
    else tl.logic = '1';
    if (a.time > b.time) tl.time = a.time;
    else tl.time = b.time;
    return tl;
}
```

- Summary

Gate Classes

- A **class** is an expanded concept of a data structure: instead of holding only data, it can hold both data and functions
- An **object** is an instantiation of a class

Ref. [1] – Classes (I) - P. 86-88

class3Primitives.h

```
class and { ... };

class or {
    char i1, i2, o1;
public:
    or (); // constructor
    void inp (char a, char b) {i1=a; i2=b;}
    void evl ();
    void out (char& w) {w=o1;}
};

class not { ... };

class xor { ... };
```

Member variable

Access specifier

Constructor

Member function

Inline implementation

External implementation

class3Primitives.cpp

```
#include "class3Primitives.h"

and::and() {o1='X';}
void and::evl () { ... }

or::or() {o1='X';}
void or::evl () {
    if ((i1=='1')||(i2=='1')) o1='1';
    else if ((i1=='0')&&(i2=='0')) o1='0';
    else o1='X';
}

not::not() {o1='X';}
void not::evl () { ... }

xor::xor() {o1='X';}
void xor::evl () { ... }
```

An access specifier can be: *private*, *public* or *protected*

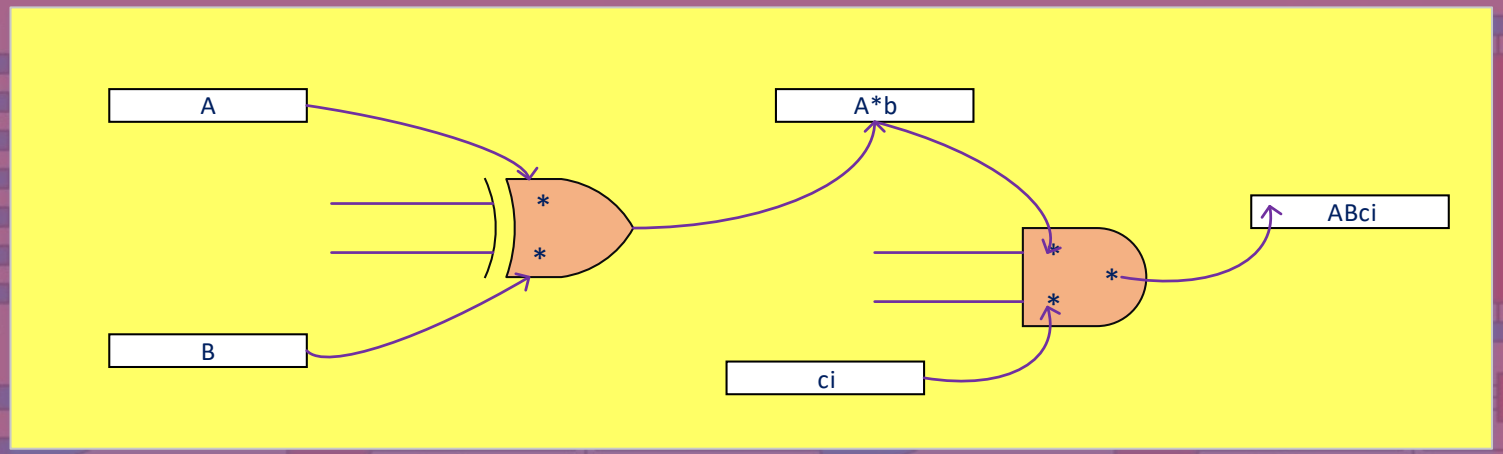
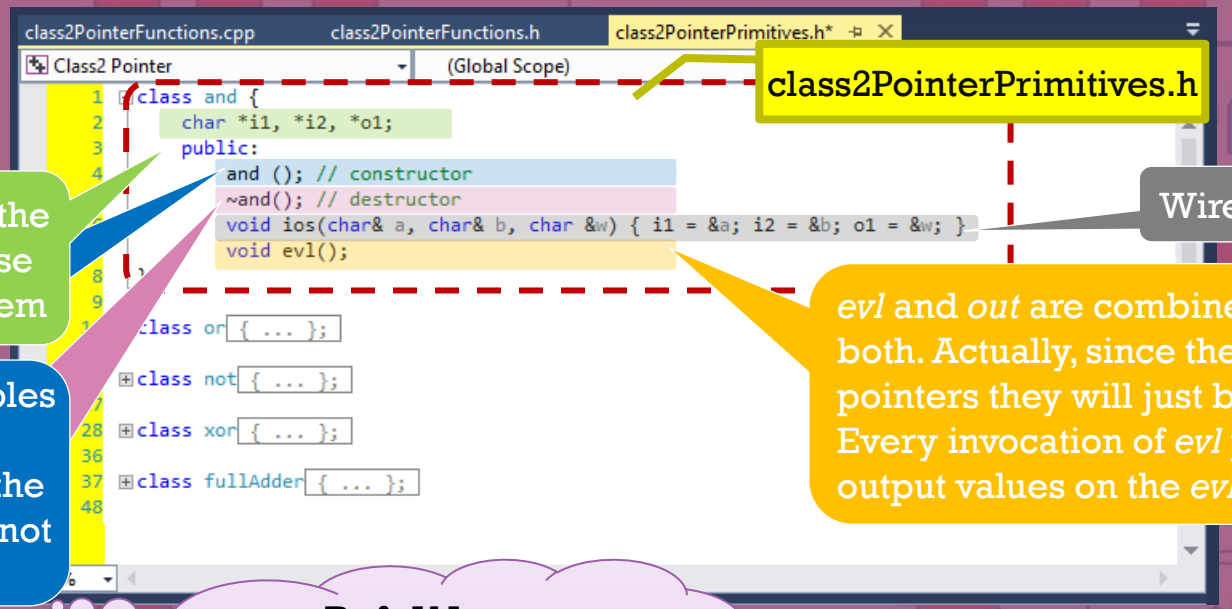
Calling the 1-bit full adder function in *main* as a testbench

Carrier Generic Modeling



Pointer Based Logic Classes

- *char* type pointer-based gate classes
  - AND gate



The class do not hold values. Since the lines are just pointers, someone else has to declare them and allocate them

Wires are of *char* type

evl and *out* are combined and *evl* does both. Actually, since the outputs are pointers they will just be updated by *evl*. Every invocation of *evl* puts the internal output values on the *evl* return value

- ✓ Constructor is to initialize variables or assign dynamic memory
- ✓ Constructor function must have the same name as the class, and cannot have any return type

Destructor fulfills the opposite functionality. It is suitable to release the memory that the object was allocated

Ref. [1] – Constructors and destructors - P. 88-90

* Gates only process and points to wires
* Wires as holders of values and transmitters

Pointer Based Logic Classes

- *char* type pointer-based gate classes (cont.)
  - AND gate

- A processing element has no wire
- A structure has wires
- Only structures has wires and those are only for internal wires

class2PointerPrimitives.cpp

```
class2PointerFunctions.h   class2PointerPrimitives.h   class2PointerPrimitives.cpp

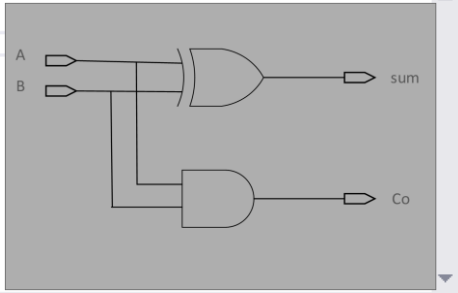
93      // to the outside wires via pointers of FA
94      *o1 = coL; *o2 = sumL;
95
96  }
97
100 %
```



Gate Classes with Power and Timing Calculation

- *wire* type pointer-based logic classes
  - AND gate

Ref. [1] – Overloading Constructors - P. 90-92

Declare *wire* to contain more information than just logic value

Member variables:
- *EventTime* to propagate delay
- *ActivityCount* to carry power consumption

wire class has two constructors
One is for *value* and *eventTime*

Inline member functions:
- They have *put* and *get* for accessing their *value* and *eventTime*
- Wires have access function to *activityCount*

wire pointers

AND constructor just ties port pointers to wires

timedLogicPrimitives.h

```
timedLogicFunctions.cpp   timedLogicUtilities.cpp   timedLogicFunctions.h
Timed Logic Classes                                 (Global Scope)

105
100 %
```

Full adder class definition declares gates and internal wires

Full adder constructor ties ports of the full adder to external wires, initialize internal wires, and then associate the ports of gates with the local wires

Destructors

It has *evl()* function that call gate classes in proper order

Gate Classes with Power and Timing Calculation

- *wire* type pointer-based logic classes (cont.)
  - Utility functions
    - For implementing this we need several utility functions for *inbit* and *outbit* to get time and value for wires

timedLogicUtilities.h

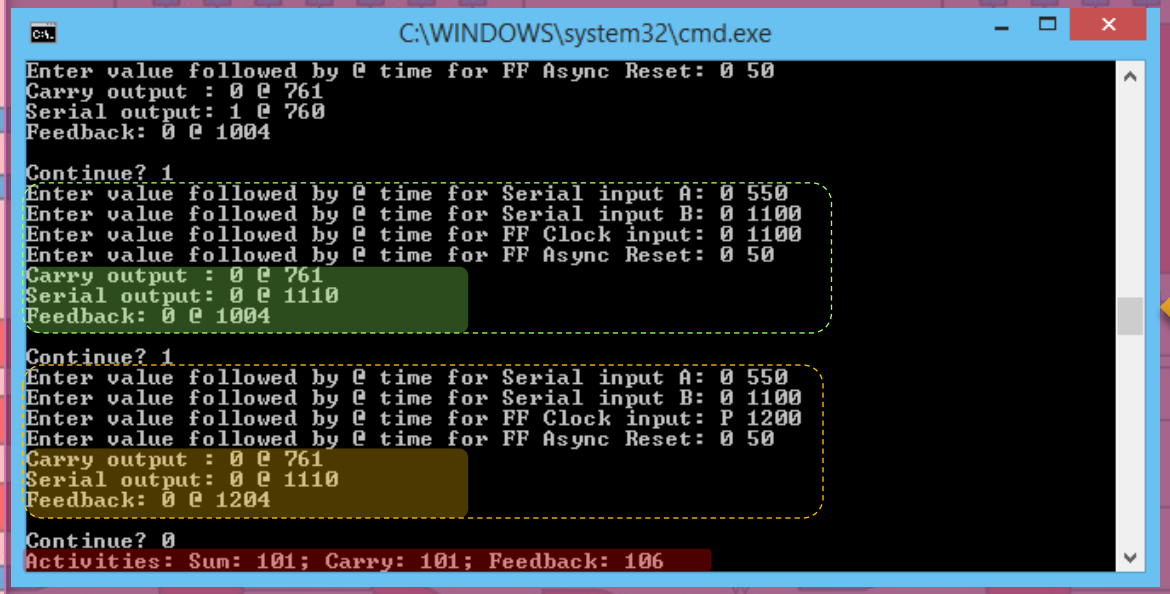
```
timedLogicUtilities.h | timedLogicFunctions.cpp | timedLogicPrimitives
Timed Logic Classes | (Global Scope)
1  #include "timedLogicPrimitives.h"
2  #include "timedLogicFunctions.h"
3
4  void inpBit(string, wire&);
5  void outBit(string, wire);
100 %
```

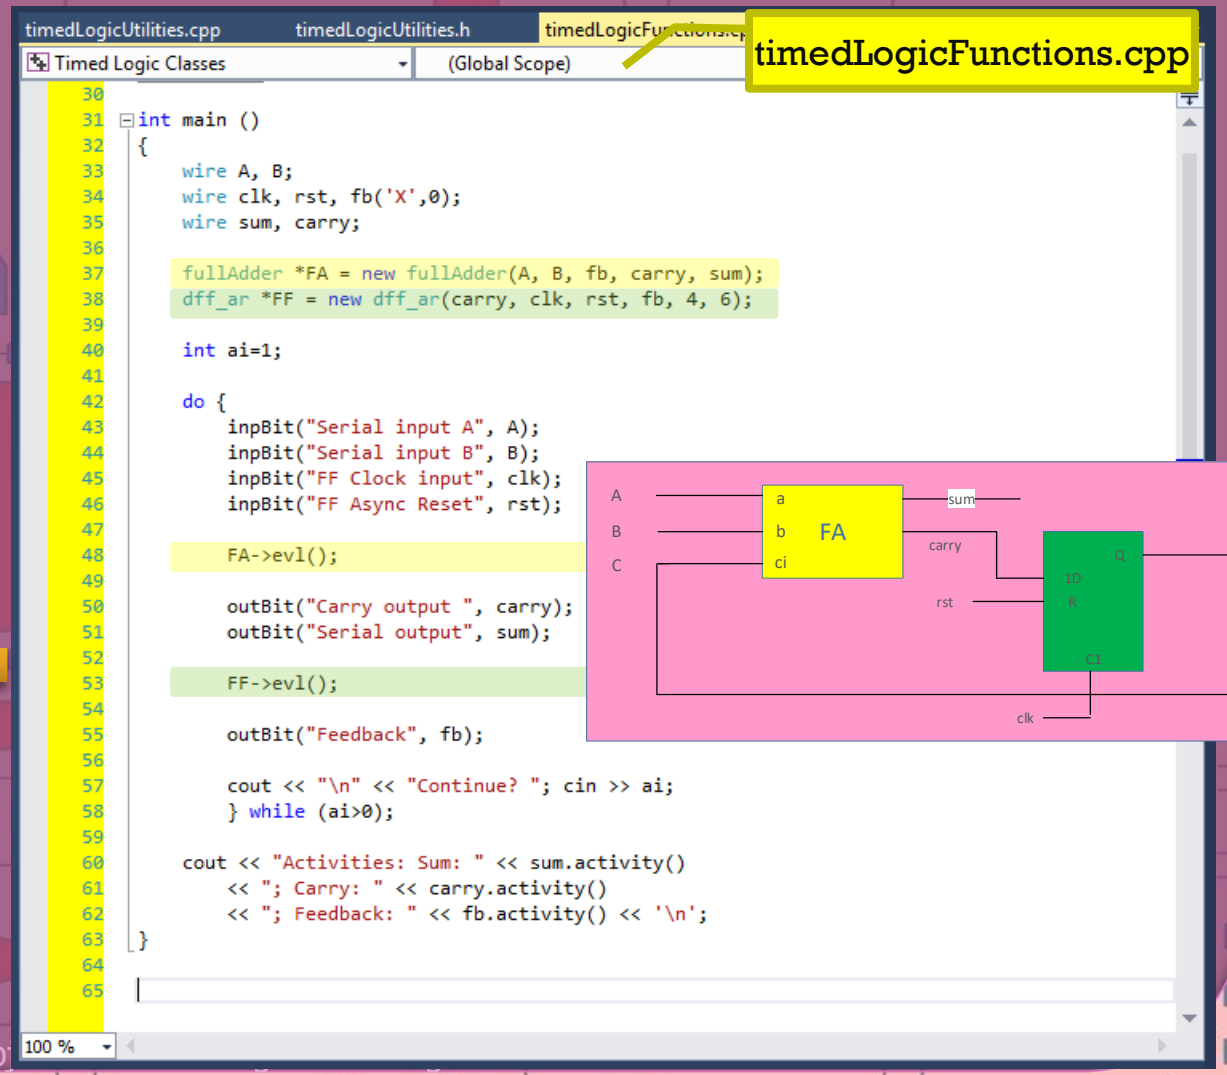
timedLogicUtilities.cpp

```
timedLogicUtilities.cpp
Timed Logic Classes | (Global Scope)
1  #include "timedLogicUtilities.h"
2
3  void inpBit(string wireName, wire& valtim) {
4      char value;
5      int time;
6      cout << "Enter value followed by @ time for " << wireName << ": ";
7      cin >> value; cin >> time;
8      valtim.put(value, time);
9  }
10
11 void outBit(string wireName, wire valtim) {
12     char value;
13     int time;
14     valtim.get(value, time);
15     cout << wireName << ": " << value << " @ " << time << "\n";
16 }
100 %
```

Gate Classes with Power and Timing Calculation

- *wire* type pointer-based logic classes (cont.)
  - Serial adder





Wire and Gate Vectors

- *wireV* type pointer-based logic classes
  - AND gate

timedVectorLogicFunctions.cpp

timedVectorLogicPrimitives.h

```
133
134 class wireV {
135 public:
136     char* value;
137     int n; //Bits
138     int eventTime;
139     int activityCount = 0;
140 public:
141     wireV(string v, int d, int size);
142     wireV(){};
143     ~wireV(){};
144     void put(string a, int d);
145     void get(string& a, int& d);
146     int activity() { return activityCount; }
147 };
148
149 class andV {
150     wireV *i1, *i2, *o1;
151     int gateDelay, lastEvent;
152     char* lastValue;
153 public:
154     andV(wireV& a, wireV& b, wireV& w, int d) :
155         i1(&a), i2(&b), o1(&w), gateDelay(d) {
156         lastValue = new char[w.n+1];
157     };
158     ~andV(){};
159     void evl();
160 };
161
```

Main difference with *wire*

wireV has an *eventTime* and an *activityCount* for a group of wires. This model is not accurate since all individual wires are treated the same

timedVectorLogicPrimitives.cpp

```
156 wireV::wireV(string v, int d, int size) : eventTime(d), n(size) {
157     int i;
158     value = new char[n + 1];
159     v.resize(n, 'X');
160     for (i = 0; i < n; i++){ *(i + value) = v.at(i); };
161     *(n + value) = '\0';
162 }
163 void wireV::put(string a, int d){
164     int i;
165     eventTime = d;
166     a.resize(n, '0');
167     for (i = 0; i < n; i++){ *(i + value) = a.at(i);};
168 }
169 void wireV::get(string& a, int& d){
170     int i;
171     d = eventTime;
172     a.resize(n, '0');
173     for (i = 0; i < n; i++){ a.at(i) = *(i + value); };
174 }
175
176 void andV::evl() {
177     int i = 0;
178
179     while (i1->value[i] != '\0'){
        if (((i1->value[i]) == '0') || ((i2->value[i]) == '0'))
            o1->value[i] = '0';
        else if ((i1->value[i] == '1') && (i2->value[i] == '1'))
            o1->value[i] = '1';
        else
            o1->value[i] = 'X';
        i++;
    };
188 }
```

Adding '\0' to make it compatible with the c++ predefined string class

Since they are clusters, individual delay and power do not apply

Wire and Gate Vectors

- *wireV* type pointer-based logic classes (cont.)
  - Utility functions

Utility for individual wires

Utility for vector wires

Object Oriented Logic Modeling

Procedural Lang. for Hardware Modeling

Types and Operators for Logic Modeling

+ Basic Logic Simulation
+ Enhanced Logic Simulation with Timing
+ More Functions for Wires and Gates
– Inheritance in Logic Structures
  - A generic gate definition
  - Gates to include timing
  - Building structures from objects
+ Hierarchical Modeling of Digital Components

Summary

A generic gate definition

- Inheritance-based logic classes

Ref. [1] – Inheritance between classes - P. 101-106

Accessible by gate classes that are inherited from gates

Different constructors for 2-input and 1-input gates and no initialization

External member functions:
- *evl()* is needed for each gate. Each gate instance use its own *evl()* function. Wires have access function to *activityCount*
- Timing activity functions for 2 and 1 input gates

Inheritance allows to create classes which are derived from other classes, so that they include some of its "parent's" members, plus its own

InheritedLogicClassPrimitives.h

```
inheritedLogicClassesFunctions.cpp
Logic Class Inheritance
fullAdder
16  class gates {
17  protected:
18      wire *i1, *i2, *o1;
19      int gateDelay, lastEvent;
20      char lastValue;
21  public:
22      gates(wire& a, wire& w, int d) :
23          i1(&a), o1(&w), gateDelay(d) {}
24      gates(wire& a, wire& b, wire& w, int d) :
25          i1(&a), i2(&b), o1(&w), gateDelay(d) {}
26      gates(){};
27      ~gates(){};
28      void evl();
29      void timingActivity2();
30      void timingActivity1();
31  };
32
33  class and: public gates {
34  public:
35      and(wire& a, wire& b, wire& w, int d) : gates(a, b, w, d) {}
36      ~and();
37      void evl();
38  };
39
40  class or: public gates {
41  public:
42      or(wire& a, wire& b, wire& w, int d) : gates(a, b, w, d) {}
43      ~or();
44      void evl();
45  };
46
47  class not: public gates {
48  public:
49      not(wire& a, wire& w, int d) : gates(a, w, d) {}
50      ~not();
51      // void evl() does not exist, will use gates::evl()
52  };
100 %
```

All gates are inherited from the *gates* class

An inherited class that does not have its own evl() can depend on the base class

A generic gate definition

- Inheritance-based logic classes (cont.)

InheritedLogicClassPrimitives.cpp

inheritedLogicClassesFunctions.cpp | inheritedLogicClassesP

Logic Class Inheritance | xor

```

104         };
105         ~fullAdder();
106         void evl();
107 };
```

Full adder class definition declares gates and internal wires

Full adder constructor ties ports of the full adder to external wires, initialize internal wires, and then associate the ports of gates with the local wires

Full adder uses inherited gates

Destructors

It has *evl()* function that call gate classes in proper order

Object Oriented Logic Modeling

43          numberOfGates++;
44      }
45      gates(){};
46      ~gates(){};
47      virtual void evl();
48      virtual void prob(){};
49  };
50
```

100 %

Gates constructor assigns an id and increments the gate count

Overloading Constructor

Virtual member functions

Virtual can be overwritten by classes that inherit from it. If not overwritten, the same *evl()* of gates will be used for an inherited class

Gate Functionality (cont.)

Static initialization must be done

Like a one input buffer

Timing activity functions for 2 and 1 input gates

Static initialization must be done

PolymorphismLogicClassesPrimitives.cpp

```
23  int wire::numberOfWires = 1;
25
26  void gates::evl() { // puts input 1 on output
27      o1->value = i1->value;
28      gates::timingActivity1();
29  }
30  void gates::timingActivity2() {
31
32      o1->eventTime = calculateEventTime(lastValue, o1->value,
33          i1->eventTime, i2->eventTime, gateDelay, lastEvent);
34
35      o1->activityCount = i1->activityCount + i2->activityCount +
36          ((lastValue == o1->value) ? 0 : 1);
37
39      lastEvent = o1->eventTime;
40      lastValue = o1->value;
    }
    void gates::timingActivity1() {
42
43      o1->eventTime = calculateEventTime(lastValue, o1->value,
44          i1->eventTime, gateDelay, lastEvent);
45
46      o1->activityCount = i1->activityCount + ((lastValue == o1->value)?0:1);
47
48      lastEvent = o1->eventTime;
49      lastValue = o1->value;
50  }
51  int gates::numberOfGates=1;
52
53  float getProb(gates* GATE){
54      return GATE->outputControlability;
55  }
56
57  void and::evl() {
58
59      if ((i1->value == '0') || (i2->value == '0'))
```

Polymorphic Gate Base

- The logic components are inherited from the *gates* class

PolymorphismLogicClassesPrimitives.h

uses the constructor of the gates class

declares member functions to overwrite *evl()* and *prob()* of the *gates* class

```
53  class and: public gates {
54  public:
55      and(wire& a, wire& b, wire& w, int d) : gates(a, b, w, d) {}
56      ~and();
57      void evl();
58      void prob();
59  };
60

Flip Flop Description Hierarchies

- A pure virtual function is a virtual function for which we don't have implementation, we only declare it. It is declared by assigning 0 in the declaration
- An abstract class is a class which have at least one pure virtual function

Ref. [1] – Abstract base classes - P. 109-112

Abstract class

PolymorphismLogicClassesPrimitives.h

Pure virtual functions

```
polymorphismLogicClassesPrimitives.h*
Logic Class Polymorphism
84
85  class flipflop {
    protected:
        wire *D, *clk, *rst, *cen, *Q;
        int clkQDelay;
        int rstQDelay;
        int lastEvent; // last time output changed
91      char lastValue;
92      bool containsReset = false;
93      float clockControlability = 0.5;
94      static int numberOfFlipflops;
95  public:
96      int flipflopIdentifier;
97      float outputControlability = 1.0;
98      flipflop(wire& d, wire& c, wire& q, int dC) :
99          D(&d), clk(&c), Q(&q), clkQDelay(dC) {
100         flipflopIdentifier = numberOfFlipflops;
101         numberOfFlipflops++;
102     };
103     ~flipflop(){};
104     virtual void evl() = 0;
105     virtual void prob() = 0;
106     virtual void init(float, char) = 0;
107 };
108
100 %
```

Flip Flop Description Hierarchies

- DFF class
  - is inherited from *flipflop* class

PolymorphismLogicClassesPrimitives.h

```
Logic Class Polymorphism
109  class DFF : public flipflop {
     public:
         DFF(wire& d, wire& c, wire& q, int dC) : flipflop(d, c, q, dC)
         { containsReset = false; };
         ~DFF(){};
         virtual void evl();
         virtual void prob();
         virtual void init(float, char);
116  };
117
100 %
```

First level derivation

PolymorphismLogicClassesPrimitives.cpp

```
polymorphismLogicClassesPrimitives.h*
Logic Class Polymorphism
125  int flipflop::numberOfFlipflops = 1;
126
127  void DFF::evl() {
128      char valueToLoad = '0';
129
130      if (!containsReset) valueToLoad = D->value;
131      else valueToLoad = (rst->value == '1') ? '0' : D->value;
132
133      if (clk->value == 'P') {
134          Q->value = valueToLoad;
135          Q->eventTime = calculateEventTime(lastValue, Q->value,
136              clk->eventTime, clkQDelay, lastEvent);
137      }
138
139      Q->eventTime = calculateEventTime(lastValue, Q->value,
140          clk->eventTime, clkQDelay, lastEvent);
141
142      Q->activityCount = (D->activityCount + clk->activityCount) * 2 +
143          ((lastValue == Q->value) ? 0 : 3);
144
145      lastEvent = Q->eventTime;
146      lastValue = Q->value;
147  }
148  void DFF::prob(){
149      outputControlability = D->controlability * clockControlability;
150      Q->controlability = outputControlability;
151  }
152  void DFF::init(float clkCon, char iniOut) {
153      clockControlability = clkCon; Q->value = iniOut;
154  }
155
100 %
```

Flip Flop Description Hierarchies

- DFF with Synchronous Reset (*DFFsR*) class
  - is inherited from *DFF* class
- DFF with Synchronous Reset and Enable (*DFFsRE*) class
  - is inherited from *DFFsR* class

PolymorphismLogicClassesPrimitives.h

Second level derivation

No evl(), so uses the one of DFF

Third level derivation

Extra arguments will be handled by *flipflop*

```
polymorphismLogic...ssesPrimitives.cpp
Logic Class Polymorphism
120  class DFFsR : public DFF {
     public:
         DFFsR(wire& d, wire& c, wire& r, wire& q, int dC, int dR) : DFF(d, c, q, dC) {
             containsReset = true;
             rst = &r;
             rstQDelay = dR;
         };
         ~DFFsR(){};
         virtual void prob();
131  class DFFsRE : public DFFsR {
     public:
         DFFsRE(wire& d, wire& c, wire& r, wire& e,
             wire& q, int dC, int dR) : DFFsR(d, c, r, q, dC, dR) {
             cen = &e;
         };
         ~DFFsRE(){};
138      virtual void evl();
139  };
140
100 %
```

PolymorphismLogicClassesPrimitives.cpp

```
morphismLogicClassesPrimitives.h*
ogic Class Polymorphism
155
156  void DFFsR::prob(){
157      outputControlability = (D->controlability + rst->controlability -
158                              D->controlability * rst->controlability ) *
159                              clockControlability;
160      Q->controlability = outputControlability;
161  }
162
163  void DFFsRE::evl() {
164      if (en->value == '1') DFFsR::evl();
165  }
```

DFFsRE calls DFFsR when value is one
